**Index of figures and tables**

| Fig./Tbl.  | Page |
|--|------|
| 1 Annual cases, mult. malignancies, follow-up / yr           | 4    |
| 2 Incidence by year of diagnosis                             | 7    |
| 3 Age distribution parameters by year of diagnosis           | 8    |
| 4 Age distribution by 5-year age group and sex               | 11   |
| 5 Age-specific incidence, proportion malignancies            | 12   |
| 6 Age distribution and age-specific incidence (chart)        | 13   |
| 7 Standardized incidence ratio of further malignancies       | 14   |
| 8a Map of cancer incidence (BRD-S) by county (chart)         | 16   |
| 8b Standardized incidence ratio (SIR) by county (chart)      | 17   |
| 9a Pts incident cohorts and mortality / yr                   | 18   |
| 9b Incidence and mortality by year of diagnosis              | 19   |
| 9c Cancer-related deaths, death certification available / yr | 20   |
| 10 Medians of age at death / yr                              | 21   |
| 11 Mortality by year of death                                | 23   |
| 12 Distribution of age at death                              | 25   |
| 13 Age-specific mortality                                    | 26   |
| 14 Further malignancies in deaths                            | 27   |
| 15 Age-specific mortality (first primaries)                  | 29   |
| 16 Age-specific mortality (single primaries)                 | 30   |
| 17 Age distribution and age-specific mortality (chart)       | 31   |
| 18a Map of cancer mortality (BRD-S) by county (chart)        | 32   |
| 18b Standardized mortality ratio (SMR) by county (chart)     | 33   |

**Global Statements about the statistics on the Internet –  
Baseline Statistics (grey button )**, **Survival (red button **)

In these analyses, the clinics and physicians of Upper Bavaria and the city and county of Landshut<sup>#</sup>, with a total of 4.69 million inhabitants, account for the frequency of cancer diseases<sup>##</sup> and the achieved long term results. Additionally, the long term survival evaluated by the Munich Cancer Registry (MCR) is compared with the results of the population-based registry in the USA (SEER), which is useful for checking the consistency of the data on an international level.

In comparing several tables, inconsistent figures may be detected. This is based on the fact that different patient cohorts are included in the base calculation, for example when proportions of multiple tumors or DCO-cases<sup>###</sup> are concerned. In other cases the individual tumor diagnosis is the basis for calculation, for example with incidence.

The foot notes describe the currentness of the data. The baseline statistics and survival data are updated annually. This yearly analysis comprises the Annual Report of the MCR.

Clinics and physicians have access to essentially more detailed data, with which they can check, compare and in the best case optimize their own data and results.

We would be pleased to receive corrections, critique and useful suggestions. Just send an e-mail to [tumor@ibe.med.uni-muenchen.de](mailto:tumor@ibe.med.uni-muenchen.de).

Munich Cancer Registry, December 2021

- # Base data has been collected since 1998. An increase in new diseases is apparent, which is an effect of two extensions in the MCR catchment area (from a base population of 2.65 million to 4.10 in 2002, and to 4.69 million in 2007).
- ## Due to the high frequency and good prognosis of non-malignant skin cancer (C44), no systematic ascertainment is performed for this diagnosis. C44 is not designated as a primary, but rather as a secondary tumor.
- ### DCO (death certificate only) identifies a cancer case that first becomes available to the MCR through the death certificate.

#### **ICD-10 codes (ICD-10 2016) used for specifying cancer site**

| ICD-10 | Description |
|--------|-------------|
|--------|-------------|

|       |                                   |
|-------|-----------------------------------|
| C44.- | Other malignant neoplasms of skin |
|-------|-----------------------------------|

#### **ICD-O-3 codes (morphology) used for specifying cancer site**

| Code | Description |
|------|-------------|
|------|-------------|

|        |  |
|--------|--|
| 8035/3 | Carcinoma with osteoclast-like giant cells     |
| 8051/3 | Verrucous carcinoma                            |
| 8070/2 | Squamous cell carcinoma in situ (Morbus Bowen) |
| 8070/3 | Squamous cell carcinoma, NOS                   |
| 8071/3 | Keratoacanthoma                                |
| 8074/3 | Spindle cell SCC                               |
| 8075/3 | Acantholytic SCC                               |
| 8082/3 | Lymphoepithelioma-like carcinoma               |
| 8084/3 | Clear cell SCC                                 |
| 8560/3 | Adenosquamous carcinoma                        |

## INCIDENCE

| 2018              | 1251           | 41.6  | 14.6   | 28.5                 | 98.3                               |
| 2019              | 940            | 42.2  | 10.9   | 20.2                 | 99.4                               |
| 2020              | 678            | 42.9  | 7.0  | 14.3                 | 98.5 ##                            |
| 1998-2020         | 17761          | 42.9  | 30.2   | 57.7                 | 97.8                               |

17,761 cases diagnosed 1998-2020 are related to a total of 14,787 patients. Currently, in 7,893 (53.4 %) of these 14,787 patients more than one malignancy of any cancer type has been registered. Hereby, groups of 4,323 / 1,919 / 1,651 (29.2 % / 13.0 % / 11.2 %) patients exist having 2 / 3 / 4+ malignancies.

- # The increases of incident cases in 2002 and 2007 reflect the expansion to additional registry areas.
- ## Please be aware that data of recent annual patient cohorts may not yet be fully processed. The years under evaluation can be retrieved from the respective headings.

How to interpret:

In 2018, a subgroup of 1,251 cases has been diagnosed, of which 41.6 % previously and/or concurrently (synchronously) had at least one other malignancy of any cancer type. In 14.6 % of cases, at least one new malignancy has occurred during the follow-up period (all numbers refer to the date of the database export, see cover sheet).

| 1998-2020         | 11113      | 62.6       | 47.4   | 33.5  | 58.4                 | 98.0                               |

11,113 cases diagnosed 1998-2020 are related to a total of 9,010 patients. Currently, in 5,253 (58.3 %) of these 9,010 patients more than one malignancy of any cancer type has been registered. Hereby, groups of 2,747 / 1,291 / 1,215 (30.5 % / 14.3 % / 13.5 %) patients exist having 2 / 3 / 4+ malignancies.

# The increases of incident cases in 2002 and 2007 reflect the expansion to additional registry areas.

## Please be aware that data of recent annual patient cohorts may not yet be fully processed. The years under evaluation can be retrieved from the respective headings.

#### How to interpret:

In 2018, a subgroup of 808 cases has been diagnosed, of which 45.9 % previously and/or concurrently (synchronously) had at least one other malignancy of any cancer type. In 16.1 % of cases, at least one new malignancy has occurred during the follow-up period (all numbers refer to the date of the database export, see cover sheet).

| 1998–2020         | 6648         | 37.4         | 35.4   | 24.9  | 56.6                 | 97.4                               |

6,648 cases diagnosed 1998-2020 are related to a total of 5,777 patients. Currently, in 2,640 (45.7 %) of these 5,777 patients more than one malignancy of any cancer type has been registered. Hereby, groups of 1,576 / 628 / 436 (27.3 % / 10.9 % / 7.5 %) patients exist having 2 / 3 / 4+ malignancies.

# The increases of incident cases in 2002 and 2007 reflect the expansion to additional registry areas.

## Please be aware that data of recent annual patient cohorts may not yet be fully processed. The years under evaluation can be retrieved from the respective headings.

#### How to interpret:

In 2018, a subgroup of 443 cases has been diagnosed, of which 34.5 % previously and/or concurrently (synchronously) had at least one other malignancy of any cancer type. In 12.0 % of cases, at least one new malignancy has occurred during the follow-up period (all numbers refer to the date of the database export, see cover sheet).

The age-specific incidence characterizes the disease risk in a particular age group. The age distribution depends on the patient population frequency in each age group and reflects the tangible clinical picture of everyday patients care (see following chart).

**Figure 6.** Age distribution (males: mean=78.2 yrs, median=79.3 yrs; females: mean=80.3 yrs, median=81.9 yrs) and age-specific incidence.

Table 7a

Standardized incidence ratio (SIR, with 95% confidence limits),  
excess absolute risk (EAR) and DCO rate of further malignancies  
for period 1998–2020

## MALES

| Diagnosis                             |                  | Observed | Expected | SIR  | CI   | CI   | EAR | DCO   |

| Median observation time (years)       |          | 2.0        |      |        |         |       |       |

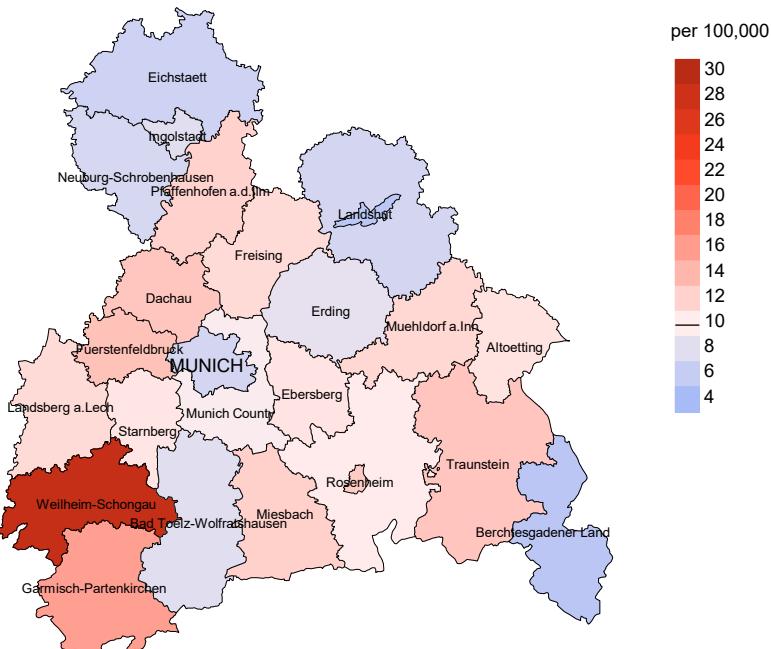

# The occurrence of further specified malignancy is statistically significant.

Further observed malignancies with count 1 to 2 are pooled in category "Others, specified".

Average incidence (Germany 1987 standard population) 2007 - 2020: Males

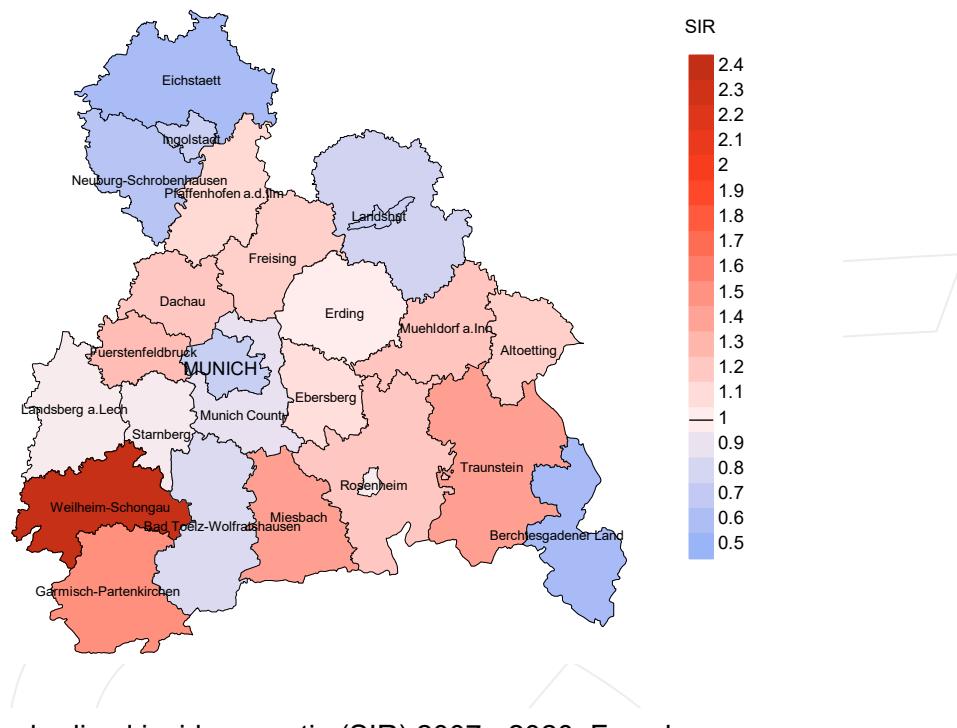

Average incidence (Germany 1987 standard population) 2007 - 2020: Females

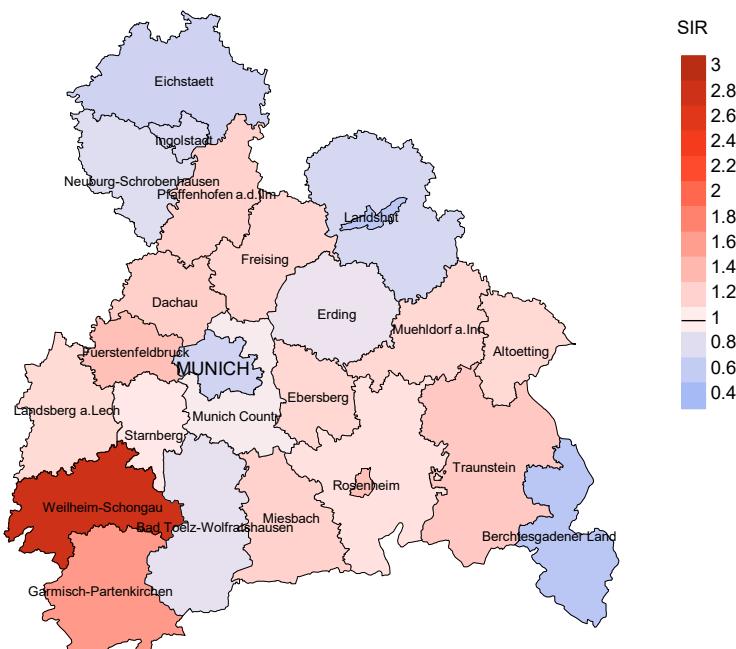

**Figure 8a.** Map of cancer incidence (german standard population) by county averaged for period 2007 to 2020. According to their individual incidence rates, the counties are displayed in different red and blue hues, being the fine white color attributed to the population mean (males 24.2/100,000 WS N=8,478, females 9.9/100,000 WS N=5,158).

The results should be interpreted with caution! E.g., in county Ebersberg with a population of 67,727 female residents (averaged) in the period from 2007 to 2020 a total of 158 women were identified with newly diagnosed squamous-cell skin ca.. Therefore, the mean incidence rate for this cancer type in this area can be calculated at 10.6/100,000 (german standard population). Though, the value of this parameter may vary with an underlying probability of 99% between 8.5 and 13.1/100,000.

## Standardized incidence ratio (SIR) 2007 - 2020: Males

## Standardized incidence ratio (SIR) 2007 - 2020: Females

**Figure 8b.** Map of standardized incidence ratio (SIR) by county averaged for period 2007 to 2020. According to their individual SIR values, the counties are displayed in different red and blue hues, being the fine white color attributed to the population overall of 1.0 (males N=8,478, females N=5,158).

The results should be interpreted with caution! E.g., in county Ebersberg with a population of 67,153 female residents (averaged) in the period from 2007 to 2020 a total of 158 women were identified with newly diagnosed squamous-cell skin ca.. Therefore, the mean standardized incidence ratio (SIR) for this cancer type in this area can be calculated at 1.17. Though, the value of this parameter may vary with an underlying probability of 99% between 0.94 and 1.43, and is therefore not statistically striking.

**MORTALITY**

| 1998–2020     | 3256     | 89.3                            | 85.5                                | 90.1                                    | 86.3  |

By 2018, Bavarians' life expectancy at birth is estimated at 79.3 years for boys and 83.8 years for girls.

Deaths of patients are considered to be cancer-related, in case that fact was recorded on the death certificate, or patients had suffered from metastasis or recurrence.

\* See corresponding tables with multiple malignancies.

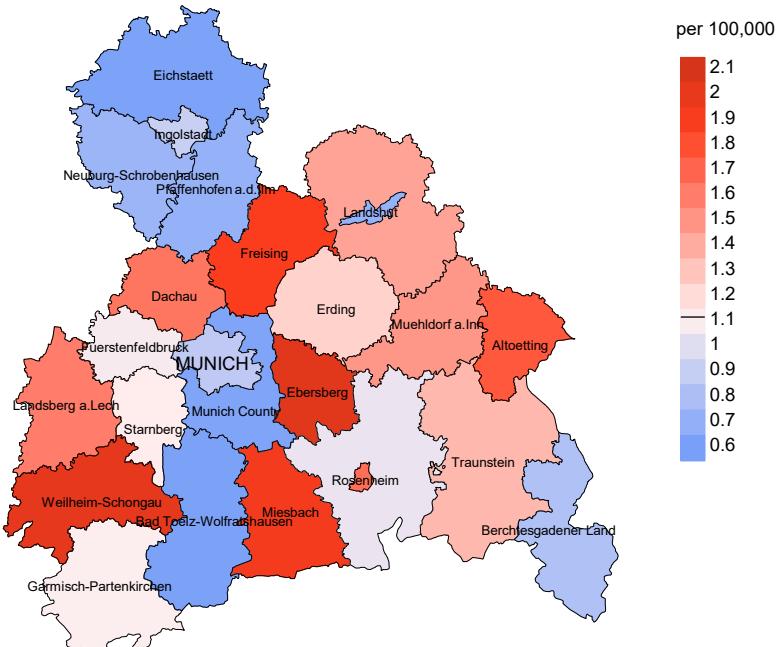

**Figure 17.** Distribution of age at death (bars; males: mean=77.9 yrs, median=78.8 yrs; females: mean=80.7 yrs, median=81.9 yrs) and age-specific mortality (all patients: solid line, patients with single primaries: dotted line). The age-specific incidence is additionally plotted for comparison (dashed line).

The difference between age at diagnosis (Table 3) and age at squamous-cell skin ca.-related death (see Table 10) should be considered.

Average mortality (Germany 1987 standard population) 2007 - 2020: Males

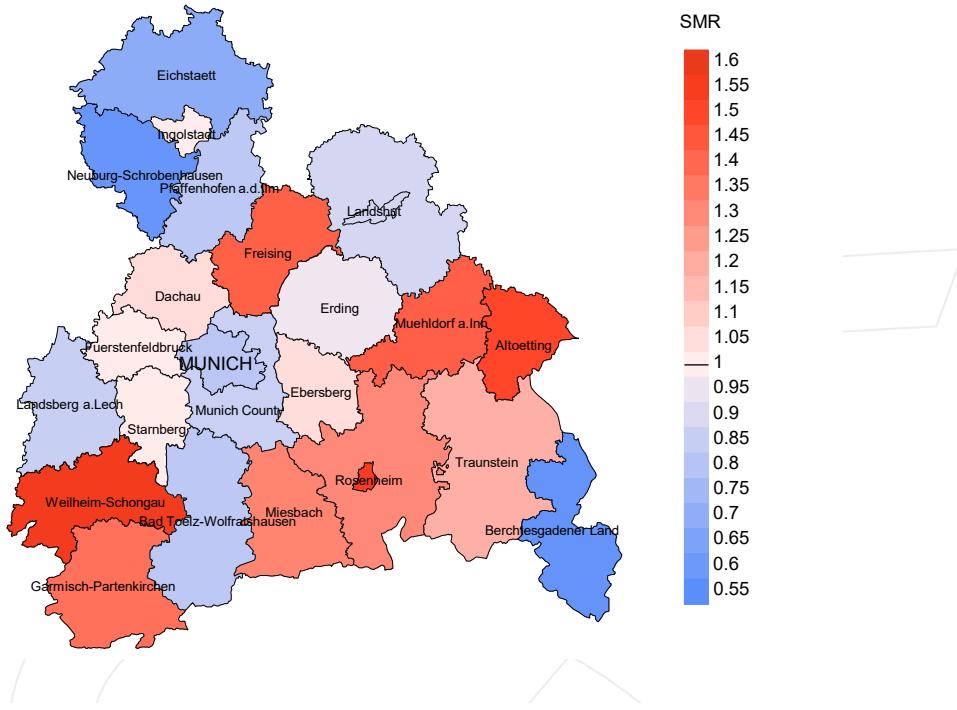

Average mortality (Germany 1987 standard population) 2007 - 2020: Females

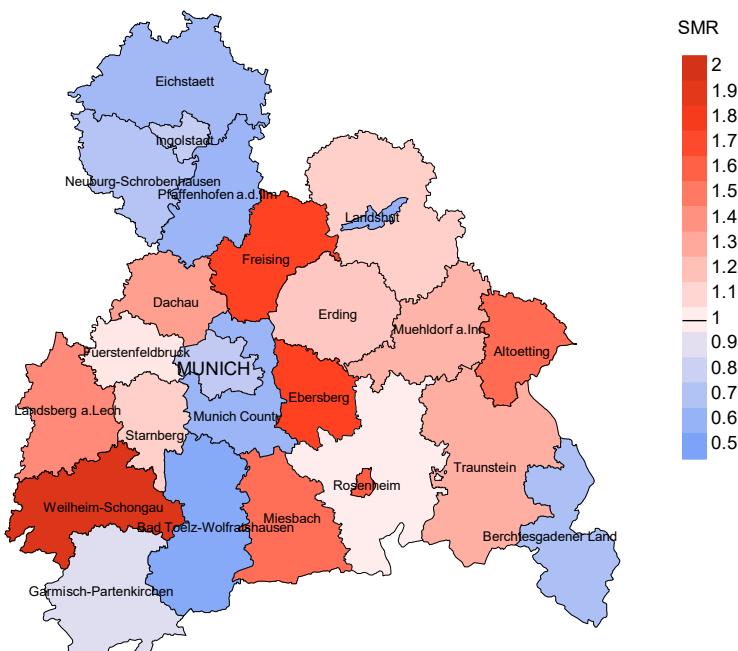

**Figure 18a.** Map of cancer mortality (german standard population) by county averaged for period 2007 to 2020. According to their individual mortality rates, the counties are displayed in different red and blue hues, being the fine white color attributed to the population mean (males 4.2/100,000 WS N=1,485, females 1.1/100,000 WS N=647).

The results should be interpreted with caution! E.g., in county Ebersberg with a population of 67,727 female residents (averaged) in the period from 2007 to 2020 a total of 29 women died from squamous-cell skin ca.. Therefore, the mean mortality rate for this cancer type in this area can be calculated at 2.0/100,000 (german standard population). Though, the value of this parameter may vary with an underlying probability of 99% between 1.2 and 3.3/100,000.

## Standardized mortality ratio (SMR) 2007 - 2020: Males

## Standardized mortality ratio (SMR) 2007 - 2020: Females

**Figure 18b.** Map of standardized mortality ratio (SMR) by county averaged for period 2007 to 2020. According to their individual SMR values, the counties are displayed in different red and blue hues, being the fine white color attributed to the population overall of 1.0 (males N=1,485, females N=647).

The results should be interpreted with caution! E.g., in county Ebersberg with a population of 67,153 female residents (averaged) in the period from 2007 to 2020 a total of 29 women died from squamous-cell skin ca.. Therefore, the mean standardized mortality ratio (SMR) for this cancer type in this area can be calculated at 1.74. Though, the value of this parameter may vary with an underlying probability of 99% between 1.02 and 2.76, and is therefore not statistically striking.

## Statistical Notes

In all tables and figures the respective reference values should be carefully considered. The incidence rates include diagnoses (with multiple primary), and death certificate only (DCO) cases, where applicable. For mortality statistics patients, diagnoses and progressive course of disease are presented. In the calculations, all courses of disease are considered whereby progressions occurred and/or death certificate identified progressive cancers were ascertained. Additionally there are three groups of disease course to consider:

### 1. All multiple primaries included

The mortality statistic describes the tumor-specific death, independent of any malignancy. The patient perspective, induced secondary malignancies, and the problem of multiple malignancies from the same primary tumor all have reasons for their inclusion.

### 2. First singular primary (no information about other prior or synchronous malignancy)

The mortality statistic describes the cancer-related death for patients who have no therapeutic restrictions due to a previous or synchronous cancer. These statistics are comparable to studies that have exclusion criteria based on a second malignancy.

### 3. Single primary (no information about other prior, syn- or metachronous malignancy)

The mortality statistic describes the tumor-specific death that occurs without any impact through secondary primaries, earlier, synchronous, later or induced. Precisely the difference between disease group 1 and 2 highlight the magnitude of the problem of secondary malignancies.

For this reason differences appear concerning official mono-causal mortality statistics. To judge the maximum deviation, 2 further tables are presented. In the first table the distribution of secondary malignancies before, at or after the described cancer are shown, that could be an alternative cause of death. In the second table, the age-specific mortality rates for all courses of disease, without designation of secondary malignancies are shown.

A previously minimally acknowledged statistic is the **age at death**, which allows for a good assessment of the quality of classification of the apparent tumor-specific death. For assumed tumor-independent deaths, the age of death should be estimated from the age of diagnosis and the normal life expectancy, whereas tumor-dependent deaths can be estimated from the age of diagnosis plus the average tumor-specific life expectancy. The comparison of different tumors demonstrates this association, if the causes of cancer and the competing cause of death are independent of each other (e.g. breast and colon versus head&neck and lung).

The ratio of mortality and incidence (mortality-to-incidence ratio, **MIR, MI-Index**) is a statistical index that allows for the evaluation of the quality of data. For diseases with poor prognoses, comparable values are obtained from all age groups, because to a large extent, the numerator and denominator contain the same cases. For tumors with a good prognosis, increasing and decreasing incidence and age-specific differences in prognosis can more strongly alter the MIR. Additionally, attention should be paid to the confidence intervals where fewer cases are reported.

The complexity of problems identified here emphasizes the importance of relative survival data for the appropriate analysis of long term results.

As a measurement of the burden of disease, the number of potential life years loss due to premature deaths in a cohort can be calculated (**PYLL**, potential years of life lost, standardized per 100,000 persons or per European standard) as well as the average loss of life years per individual (**AYLL**, average years of life lost). Depending upon the analytic aim (health economy, prevention, health care research) different methods exist for the generation of these measurements. In the results presented here, the age for a premature death is considered to be before 70 years, according to the guidelines of the OECD and the WHO (as seen in the abbreviation PYLL-70 or AYLL-70).
