5e Observed post-progression survival by period of progression (chart)	10
5f Observed post-progression survival by period of progression (table)	10

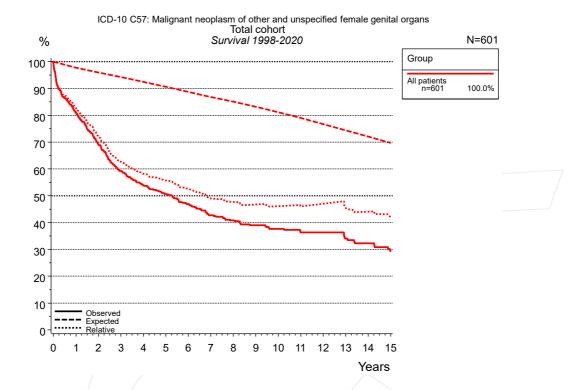

**Figure 1a.** Relative survival of patients with female genitale cancer NOS by period of diagnosis. Included in the evaluation are 677 cases diagnosed between 1988 and 2020.

The survival results of the SEER program (Surveillance, Epidemiology, and End Results) of the American National Cancer Institute (NCI) are summarized as the period of diagnosis from 2000 to 2018, and are represented by colored diamonds in order to facilitate comparisons between MCR and SEER.

The presented survival curves are derived from clinical records with valid follow-up informations, which means that death certificate cases (DCO) cases are omitted from the analysis. With this one restriction, the MCR has provided populationbased statistics since 1998, collecting data on all cancer cases in the region of southern Bavaria. Historical data of previous time periods can be heavily selected, therefore, univariate survival comparisons of the presented time periods must be carefully considered. Nonetheless, all calculable survival curves are depicted to facilitate the comparison of long time follow-up analyses of relative survival between particular cancers.

	Period of diagnosis

**Table 5b.** Time to first progression of patients with female genitale cancer NOS for period 1998-2020 (N=599), also showing the total of progression events (Events) and of deaths as competing risk (compet.).

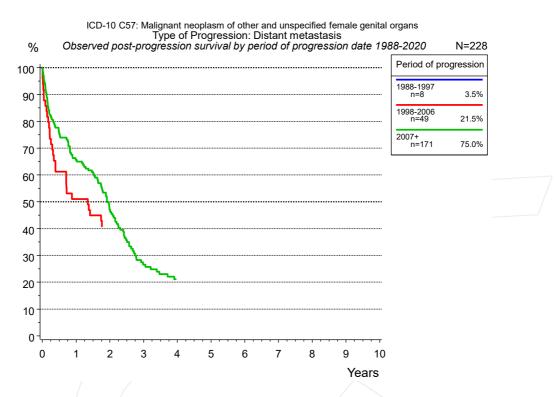

**Figure 5c.** Observed post-progression survival of 274 patients with female genitale cancer NOS diagnosed between 1998 and 2020. These 274 patients with documented progression events during their course of disease represent 45.7 % of the totally 599 evaluated cases (incl. M1, n=108, 18.0 %). Patients with cancer relapse documented via death certificates only were excluded (n=82, 13.7 %). Multiple progression types on different sites are included in the evaluation even when not occuring synchronously. The NOS (not otherwise specified) class is included under the condition, that it is the one and only progression type during the course of disease.

Medical record documentation often lacks the linguistic severity to distinguish between local relapse, regional lymph node metastasis and distant spread in solid cancers. Frequently, the statement "not specified" is the only information in registries regarding relapse of the disease. The category "Any type" denotes all cases who suffered from at least one relapse during the course of disease (incl. primary M1-status). Although, the real number of relapsed patients is likely to be much higher. The accumulated percentage of patients with local relapse or distant metastasis exceeds the 100 % value because patients are potientially considered in more than one subgroup.

	Т	ype of progr	ression		
	Any type	Distant metastasis	Locoregional relapse	NOS	
	n=274	n=213	n=123	n=35	
Years	%	%	%	%	
0	100.0	100.0	100.0	100.0	
1	64.8	63.0	65.2		
2	48.2	45.2	48.5		
3	30.6	25.4	31.7		
4	23.0	18.7			
5	19.0	15.6			
6	15.2				

**Table 5d.** Observed post-progression survival of patients with female genitale cancer NOS for period 1998-2020 (N=274).

**Figure 5e.** Observed post-progression (distant metastasis) survival of 228 patients with female genitale cancer NOS diagnosed between 1988 and 2020 by period of progression.

Period of progression							
	1998-2006	2007+					
	n=49	n=171					
Years	%	%					
0	100.0	100.0					
1	51.0	65.6					
2		46.9					
3		26.5					

**Table 5f.** Observed post-progression (distant metastasis) survival of patients with female genitale cancer NOS for period 1988-2020 by period of progression (N=228).
