Figure 1a. Relative survival of patients with Mantle cell lymphoma by period of diagnosis. Included in the evaluation are 529 cases diagnosed between 1988 and 2016.

The survival results of the SEER program (Surveillance, Epidemiology, and End Results) of the American National Cancer Institute (NCI) are summarized as the period of diagnosis from 2000 to 2014, and are represented by colored diamonds in order to facilitate comparisons between MCR and SEER.

The presented survival curves are derived from clinical records with valid follow-up informations, which means that death certificate cases (DCO) cases are omitted from the analysis. With this one restriction, the MCR has provided population-based statistics since 1998, collecting data on all cancer cases in the region of southern Bavaria. Historical data of previous time periods can be heavily selected, therefore, univariate survival comparisons of the presented time periods must be carefully considered. Nonetheless, all calculable survival curves are depicted to facilitate the comparison of long time follow-up analyses of relative survival between particular cancers.

Years	Period of diagnosis					
	1988-1997 n=60		1998-2006 n=170		2007+ n=299	
	obs. %	rel. %	obs. %	rel. %	obs. %	rel. %
0	100.0	100.0	100.0	100.0	100.0	100.0
1	84.7	87.5	88.8	91.1	79.9	81.7
2	78.0	83.8	76.9	80.9	71.1	74.3
3	69.4	77.8	71.5	76.7	68.1	72.6

9	35.2	44.6		
10	31.3	40.8		

Table 2b. Observed (obs.) and relative (rel.) survival of patients with Mantle cell lymphoma by sex for period 1998-2016 (N=469).

Figure 2c. Conditional relative 2 / 5-year survival of patients with Mantle cell lymphoma by sex. For 529 of 529 cases diagnosed between 1988 and 2016 valid data could be obtained for this item.

Years	Sex					
	n	Male		n	Female	
		Cond. surv. % 2 yrs	Cond. surv. % 5 yrs		Cond. surv. % 2 yrs	Cond. surv. % 5 yrs
0	379	79.4	57.7	150	74.0	62.3
1	309	85.9	59.8	110	90.9	65.5
2	252	82.0	61.7	96	89.4	66.6
3	219	76.8	58.9	85	84.2	61.3
4	169	80.2	63.6	71	80.4	66.7
5	130	85.0	66.1	61	78.2	
6	105	84.4	72.0	45	84.5	
7	84	85.1		36	87.8	
8	64	85.4				
9	50	91.5				

Table 2d. Conditional relative 2 / 5-year survival of patients with Mantle cell lymphoma by sex for period 1988-2016 (N=529).

Conditional relative survival rates refer to the relative survival probability, in this case for 2 and 5 years after cancer diagnosis, compared to the age- and sex-matched population (=100 %) under the condition of being alive for a certain time period (x-axis in Figure 2a). The results illustrate to what extent the cancer induced mortality of particular subgroups declines in the subsequent years after detection of the malignancy. For instance, according to the presented survival statistics, patients in the subgroup sex="Male", who are alive at least 3 years after cancer diagnosis, the conditional relative 2-year survival rate is 76.8% (n=219).

Figure 3a. Observed survival of patients with Mantle cell lymphoma by age category. Included in the evaluation are 529 cases diagnosed between 1988 and 2016.

Figure 3b. Relative survival of patients with Mantle cell lymphoma by age category. Included in the evaluation are 529 cases diagnosed between 1988 and 2016.

Years	Age category									
	0-49 yrs n=56		50-59 yrs n=90		60-69 yrs n=162		70-79 yrs n=159		80+ yrs n=62

8							31.1	37.2		
9							29.3	35.7		

Table 4b. Observed (obs.) and relative (rel.) survival of patients with Mantle cell lymphoma by Ann Arbor staging for period 1988-2016 (N=359).

Figure 4c. Relative survival of patients with Mantle cell lymphoma by Ann Arbor staging. For 319 of 469 cases diagnosed between 1998 and 2016 valid data could be obtained for this item. The grey line represents the subgroup of 150 patients with missing values regarding Ann Arbor staging (32.0 % of 469 patients, the percent values of all other categories are related to n=319). Subgroups with sample size <20 are omitted from the chart.

Years	Ann Arbor staging							
	II n=24		III n=57		IV n=220		NA n=150	
	obs. %	rel. %	obs. %	rel. %	obs. %	rel. %	obs. %	rel. %

8					33.3	39.8		
9					31.2	38.1		

Table 4d. Observed (obs.) and relative (rel.) survival of patients with Mantle cell lymphoma by Ann Arbor staging for period 1998-2016 (N=319).

Figure 5a. Time to first progression of 467 patients with Mantle cell lymphoma diagnosed between 1998 and 2016 (in solid cancers M0 only) estimated by cumulative incidence function (CI, solid line) accounting for death as competing risk and by inverse Kaplan-Meier estimate (1-KM, dashed line). The frequency of events may be underestimated due to underreporting.

Years	Type of progression	
	Any type (CI)	Any type (1-KM)
	n=467 %	n=467 %
0	0.0	0.0
1	44.1	44.4
2	56.4	57.0
3	63.0	64.0
4	70.7	72.2
5	72.4	74.0
6	74.3	76.2
7	76.6	78.7
8	79.5	82.1

Table 5b. Time to first progression of patients with Mantle cell lymphoma for period 1998-2016 (N=467).

Figure 5c. Observed post-progression survival of 270 patients with Mantle cell lymphoma diagnosed between 1998 and 2016. These 270 patients with documented progression events during their course of disease represent 57.8 % of the totally 467 evaluated cases. Patients with cancer relapse documented via death certificates only were excluded (n=58, 12.4 %).

Medical record documentation often lacks the linguistic severity to distinguish between local relapse, regional lymph node metastasis and distant spread in solid cancers. Frequently, the statement “not specified” is the only information in registries regarding relapse of the disease. The category “Any type” denotes all cases who suffered from at least one relapse during the course of disease (incl. primary M1-status). Although, the real number of relapsed patients is likely to be much higher. The accumulated percentage of patients with local relapse or distant metastasis exceeds the 100 % value because patients are potentially considered in more than one subgroup.

Type of progression	
Years	Any type n=270 %
0	100.0
1	76.7
2	64.8
3	55.3
4	48.8
5	38.0
6	33.9
7	29.6
8	27.0
9	25.0

Table 5d. Observed post-progression survival of patients with Mantle cell lymphoma for period 1998-2016 (N=270).

Figure 5e. Observed post-progression (any type) survival of 308 patients with Mantle cell lymphoma diagnosed between 1988 and 2016 by period of progression.

Years	Period of progression		
	1988-1997 n=24 %	1998-2006 n=101 %	2007+ n=183 %
0	100.0	100.0	100.0
1		85.1	72.1
2		74.1	58.2
3		62.1	50.5
4		54.0	44.9

DCO Death certificate only Death certificate provides the only notification to the registry.

NA Not available

NOS Not otherwise specified

OS Overall/Observed survival Overall/Observed survival (Kaplan-Meier estimate)
Date of entry: diagnosis
Event: death from any cause

RS Relative survival Survival compared to “general population”,
ratio of observed to expected survival (Ederer II method),
reflecting cancer specific survival

AS Assembled survival Assembled chart of
observed, expected, relative survival

CS Conditional survival Survival probability under the condition of surviving
a given period of time

TTP Time to progression Time to first progression / relapse
Date of entry: diagnosis
Event: (progression / relapse): first local-, lymph node recurrence,
distant metastasis or unspecified progression

1-KM 1 minus Kaplan-Meier estimator
 (“inverse” Kaplan-Meier estimator)

CI Cumulative incidence
Death as competing risk (according to Kalbfleisch und Prentice)

PPS Post-progression survival Survival since first progression / relapse (Kaplan-Meier estimate)
Date of entry (progression / relapse): first local-, lymph node
recurrence, distant metastasis or unspecified progression
Event: death from any cause
