## Cancer statistics: Survival

### C51-C58: Fem. genitale cancer

Year of diagnosis	1988-2012
Patients	23,533
Diseases	23,980
Cases evaluated	14,109
Creation date	03/25/2014
Export date	02/12/2014
Population (females)	2.3 m

[http://www.tumorregister-muenchen.de/en/facts/surv/surv\\_C5158E.pdf](http://www.tumorregister-muenchen.de/en/facts/surv/surv_C5158E.pdf)

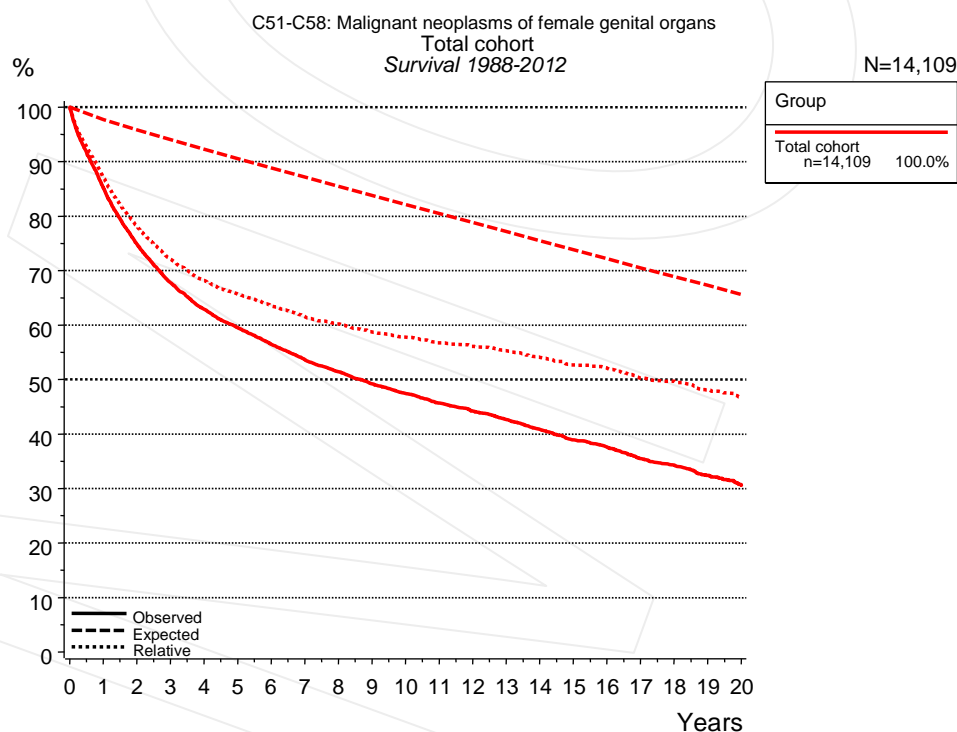

**Figure 1a.** Relative survival of patients with fem. genitale cancer by period of diagnosis. Included in the evaluation are 14,109 cases diagnosed between 1988 and 2012.

The survival results of the SEER program (Surveillance, Epidemiology, and End Results) of the American National Cancer Institute (NCI) are summarized as the period of diagnosis from 1998 to 2009, and are represented by green diamonds in order to facilitate comparisons between MCR and SEER.

The presented survival curves are derived from clinical records with valid follow-up informations, which means that death certificate cases (DCO) cases are omitted from the analysis. With this one restriction, the MCR has provided population-based statistics since 1988, collecting data on all cancer cases in the region of southern Bavaria. Historical data of previous time periods can be heavily selected, therefore, univariate survival comparisons of the presented time periods must be carefully considered. Nonetheless, all calculable survival curves are depicted to facilitate the comparison of long time follow-up analyses of relative survival between particular cancers.

**Table 4j.** Conditional relative 5-year survival of patients with fem. genitale cancer by extent of disease for period 1988-2012 (N=7,778).

Conditional relative survival rates refer to the relative survival probability, in this case for 5 years after cancer diagnosis, compared to the age- and sex-matched population (=100%) under the condition of being alive for a certain time period (x-axis in Figure 4g). The results illustrate to what extent the cancer induced mortality of particular subgroups declines in the subsequent years after detection of the malignancy. For instance, according to the presented survival statistics, patients in the subgroup extent of disease="Local", who are alive at least 3 years after cancer diagnosis, the conditional relative 5-year survival rate is 87.1% (n=3,255).

**Figure 5a.** Observed post-progression survival of 4,090 patients with fem. genitale cancer diagnosed between 1988 and 2012 (incl. M1). These 4,090 patients with documented progression events during their course of disease represent 29.0% of the totally 14,109 evaluated cases. Patients with cancer relapse documented via death certificates only were excluded (n=1,087, 7.7%). Multiple progression types on different sites are included in the evaluation even when not occurring synchronously. The NOS (not otherwise specified) class is included under the condition, that it is the one and only progression type during the course of disease.

Medical record documentation often lacks the linguistic severity to distinguish between local relapse, regional lymph node metastasis and distant spread in solid cancers. Frequently, the statement “not specified” is the only information in registries regarding relapse of the disease. The category “All types” denotes all cases who suffered from at least one relapse during the course of disease (incl. primary M1-status). Although, the real number of relapsed patients is likely to be much higher. The accumulated percentage of patients with local relapse or distant metastasis exceeds the 100% value because patients are potentially considered in more than one subgroup.

Months	Type of progression

RS	Relative Survival. Ratio of observed and expected survival (derived from the normal population)
SEER	Surveillance, Epidemiology, and End Results, USA
TTP	Time to progression Date of entry: Date of diagnosis Event (Progression): First local recurrence, lymph node relapse or distant metastasis, unspecified recurrence First all-cause recurrence is illustrated by survival curves (Kaplan-Meier estimate). First local recurrence, lymph node relapse or distant metastasis are depicted cumulatively, where applicable ("reverse" Kaplan-Meier estimate).
UICC	Union for International Cancer Control, Geneva
