C51: Vulva cancer

Figure 1a. Relative survival of patients with vulva cancer by period of diagnosis. Included in the evaluation are 817 cases diagnosed between 1988 and 2013.

The survival results of the SEER program (Surveillance, Epidemiology, and End Results) of the American National Cancer Institute (NCI) are summarized as the period of diagnosis from 1998 to 2011, and are represented by gray diamonds in order to facilitate comparisons between MCR and SEER.

The presented survival curves are derived from clinical records with valid follow-up informations, which means that death certificate cases (DCO) cases are omitted from the analysis. With this one restriction, the MCR has provided populationbased statistics since 1988, collecting data on all cancer cases in the region of southern Bavaria. Historical data of previous time periods can be heavily selected, therefore, univariate survival comparisons of the presented time periods must be carefully considered. Nonetheless, all calculable survival curves are depicted to facilitate the comparison of long time follow-up analyses of relative survival between particular cancers.

Table 3b. Observed (obs.) and relative (rel.) survival of patients with vulva cancer by age category for period 1988-2013 (N=817).

Figure 4a. Relative survival of patients with vulva cancer by FIGO. For 739 of 817 cases diagnosed between 1988 and 2013 valid data could be obtained for this item. For a total of 413 cases an evaluable classification was established. The grey line represents the subgroup of 404 patients with missing values regarding FIGO (49.4% of 817 patients, the percent values of all other categories are related to n=413).

Table 4b. Observed (obs.) and relative (rel.) survival of patients with vulva cancer by FIGO for period 1988-2013 (N=413).

Figure 5a. Observed post-progression survival of 263 patients with vulva cancer diagnosed between 1988 and 2013 (incl. M1). These 263 patients with documented progression events during their course of disease represent 32.2% of the totally 817 evaluated cases. Patients with cancer relapse documented via death certificates only were excluded (n=66, 8.1%). Multiple progression types on different sites are included in the evaluation even when not occuring synchronously. The

NOS (not otherwise specified) class is included under the condition, that it is the one and only progression type during the course of disease.

Medical record documentation often lacks the linguistic severity to distinguish between local relapse, regional lymph node metastasis and distant spread in solid cancers. Frequently, the statement "not specified" is the only information in registries regarding relapse of the disease. The category "All types" denotes all cases who suffered from at least one relapse during the course of disease (incl. primary M1-status). Although, the real number of relapsed patients is likely to be much higher. The accumulated percentage of patients with local relapse or distant metastasis exceeds the 100% value because patients are potientially considered in more than one subgroup.

		Type of prog	ression	
	All types	Distant metastasis	Locoregional progress	NOS
	n=263	n=95	n=186	n=39
Months	%	%	%	%

- OS Observed/overall survival (Kaplan-Meier estimate)
- RS Relative survival, compared to the general population, ratio of observed to expected survival (Ederer II method), reflecting excess mortality among cancer patients
- AS Assembled survival chart (observed, expected, relative)
- PPS Post-progression survival, survival since first relapse (Kaplan-Meier estimate) Date of entry: Date of first locoregional recurrence, distant metastasis, unspecified

progression Event:

- Death of all causes
- CS Conditional survival, survival probability under the condition of surviving a given period of time
