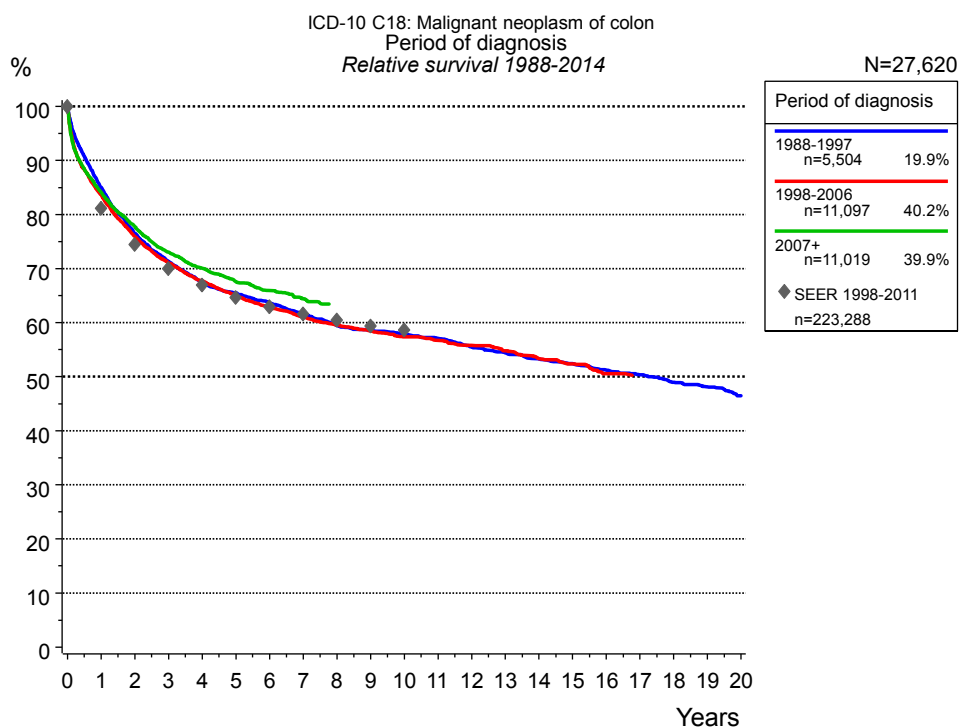

Figure 1a. Relative survival of patients with colon cancer by period of diagnosis. Included in the evaluation are 27,620 cases diagnosed between 1988 and 2014.

The survival results of the SEER program (Surveillance, Epidemiology, and End Results) of the American National Cancer Institute (NCI) are summarized as the period of diagnosis from 1998 to 2011, and are represented by gray diamonds in order to facilitate comparisons between MCR and SEER.

The presented survival curves are derived from clinical records with valid follow-up informations, which means that death certificate cases (DCO) cases are omitted from the analysis. With this one restriction, the MCR has provided population-based statistics since 1998, collecting data on all cancer cases in the region of southern Bavaria. Historical data of previous time periods can be heavily selected, therefore, univariate survival comparisons of the presented time periods must be carefully considered. Nonetheless, all calculable survival curves are depicted to facilitate the comparison of long time follow-up analyses of relative survival between particular cancers.

Years	Period of diagnosis

Table 4f. Conditional relative 5-year survival of patients with colon cancer by UICC for period 1988-2014 (N=26,166).

Conditional relative survival rates refer to the relative survival probability, in this case for 5 years after cancer diagnosis, compared to the age- and sex-matched population (=100%) under the condition of being alive for a certain time period (x-axis in Figure 4c). The results illustrate to what extent the cancer induced mortality of particular subgroups declines in the subsequent years after detection of the malignancy. For instance, according to the presented survival statistics, patients in the subgroup UICC="I", who are alive at least 3 years after cancer diagnosis, the conditional relative 5-year survival rate is 96.6% (n=4,033).

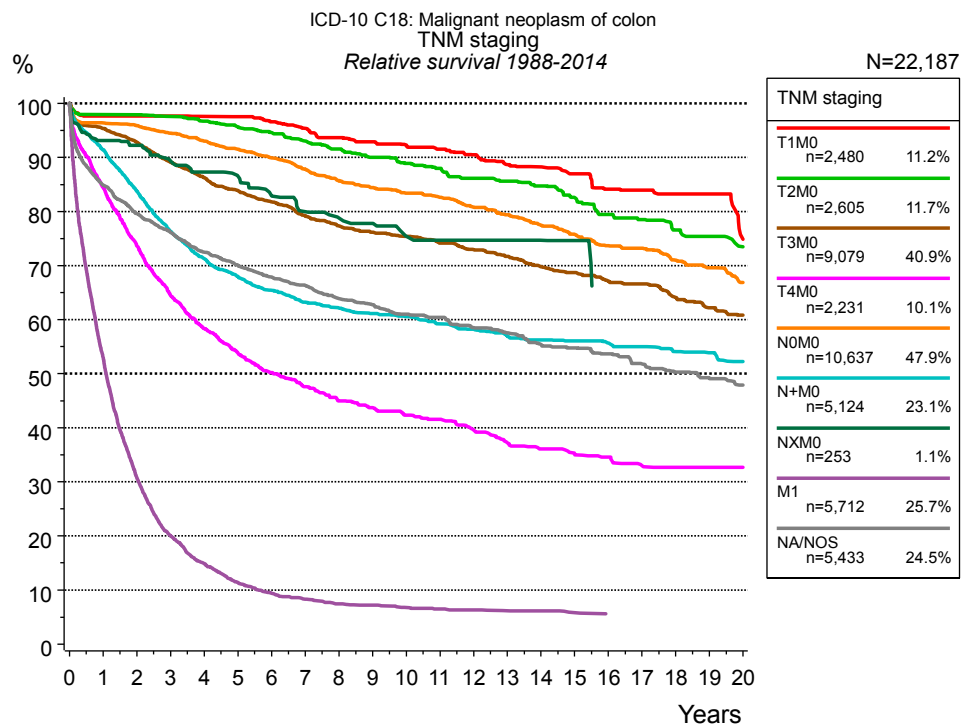

Figure 4g. Relative survival of patients with colon cancer by TNM staging. For 26,283 of 27,620 cases diagnosed between 1988 and 2014 valid data could be obtained for this item. For a total of 22,187 cases an evaluable classification was established. The accumulated percentage exceeds the 100% value because patients are potentially considered in more than one subgroup. The grey line represents the subgroup of 5,433 patients with missing values regarding TNM staging (19.7 % of 27,620 patients, the percent values of all other categories are related to n=22,187).

Table 4h. Observed (obs.) and relative (rel.) survival of patients with colon cancer by TNM staging for period 1988-2014 (N=38,121).

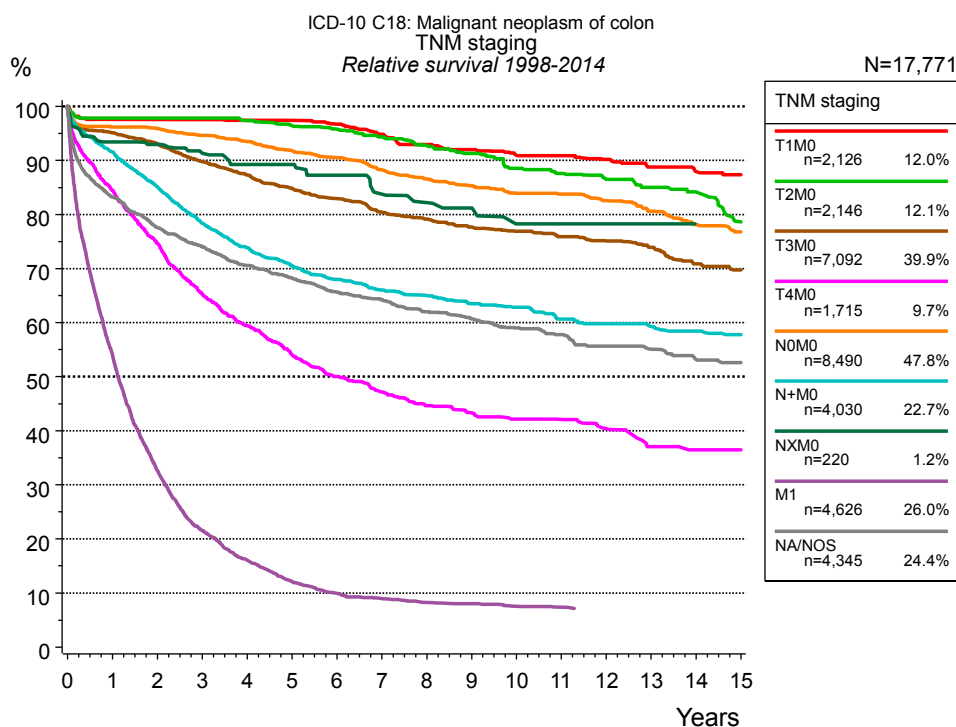

Figure 4i. Relative survival of patients with colon cancer by TNM staging. For 21,183 of 22,116 cases diagnosed between 1998 and 2014 valid data could be obtained for this item. For a total of 17,771 cases an evaluable classification was established. The accumulated percentage exceeds the 100% value because patients are potentially considered in more than one subgroup. The grey line represents the subgroup of 4,345 patients with missing values regarding TNM staging (19.6 % of 22,116 patients, the percent values of all other categories are related to n=17,771).

Table 4j. Observed (obs.) and relative (rel.) survival of patients with colon cancer by TNM staging for period 1998-2014 (N=30,445).

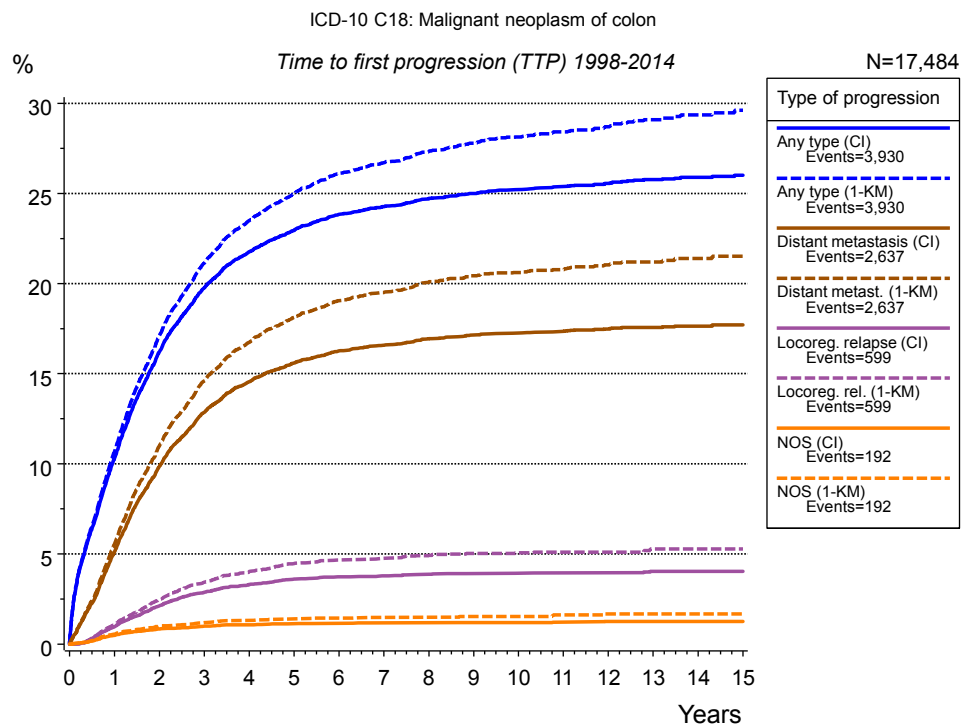

Figure 5a. Time to first progression of 17,484 patients with colon cancer diagnosed between 1998 and 2014 (M0 only in solid cancers) estimated by cumulative incidence function (CI, solid line) accounting for death as competing risk and by inverse Kaplan-Meier estimate (1-KM, dashed line). The frequency of events may be underestimated due to underreporting.

Table 5b. Time to first progression of patients with colon cancer for period 1998-2014 (N=17,484).

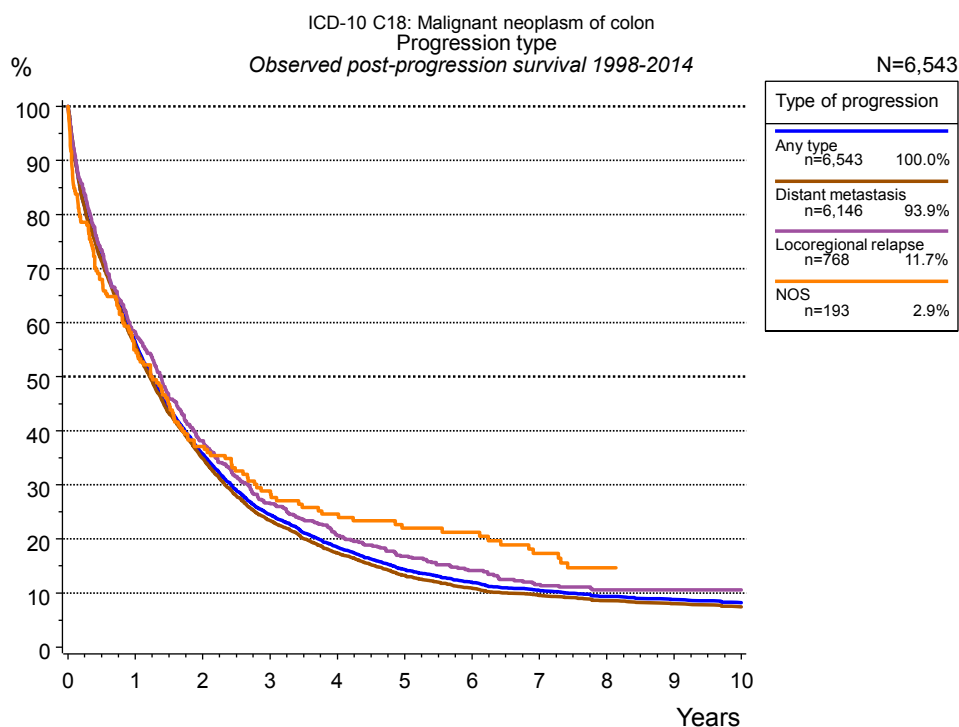

Figure 5c. Observed post-progression survival of 6,543 patients with colon cancer diagnosed between 1998 and 2014. These 6,543 patients with documented progression events during their course of disease represent 29.7 % of the totally 22,027 evaluated cases (incl. M1, n=4,543, 20.6 %). Patients with cancer relapse documented via death certificates only were excluded (n=1,930, 8.8 %). Multiple progression types on different sites are included in the evaluation even when not occurring synchronously. The NOS (not otherwise specified) class is included under the condition, that it is the one and only progression type during the course of disease.

Medical record documentation often lacks the linguistic severity to distinguish between local relapse, regional lymph node metastasis and distant spread in solid cancers. Frequently, the statement “not specified” is the only information in registries regarding relapse of the disease. The category “Any type” denotes all cases who suffered from at least one relapse during the course of disease (incl. primary M1-status). Although, the real number of relapsed patients is likely to be much higher. The accumulated percentage of patients with local relapse or distant metastasis exceeds the 100% value because patients are potentially considered in more than one subgroup.

Years	Type of progression
