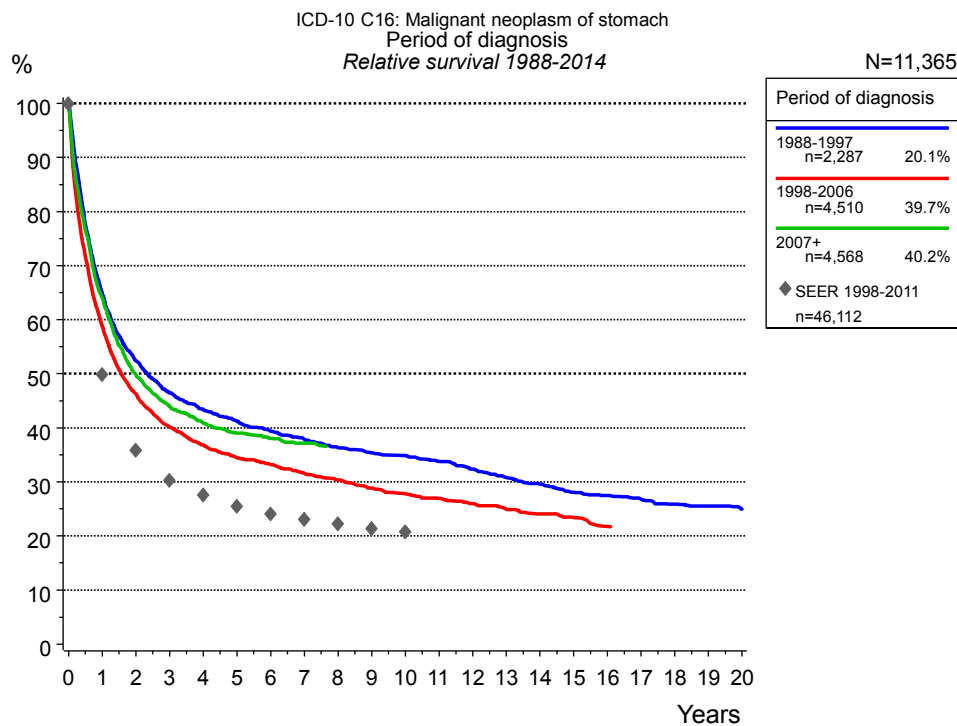

Figure 1a. Relative survival of patients with stomach cancer by period of diagnosis. Included in the evaluation are 11,365 cases diagnosed between 1988 and 2014.

The survival results of the SEER program (Surveillance, Epidemiology, and End Results) of the American National Cancer Institute (NCI) are summarized as the period of diagnosis from 1998 to 2011, and are represented by gray diamonds in order to facilitate comparisons between MCR and SEER.

The presented survival curves are derived from clinical records with valid follow-up informations, which means that death certificate cases (DCO) cases are omitted from the analysis. With this one restriction, the MCR has provided population-based statistics since 1998, collecting data on all cancer cases in the region of southern Bavaria. Historical data of previous time periods can be heavily selected, therefore, univariate survival comparisons of the presented time periods must be carefully considered. Nonetheless, all calculable survival curves are depicted to facilitate the comparison of long time follow-up analyses of relative survival between particular cancers.

Years	Period of diagnosis

Table 4d. Observed (obs.) and relative (rel.) survival of patients with stomach cancer by UICC for period 1998-2014 (N=6,258).

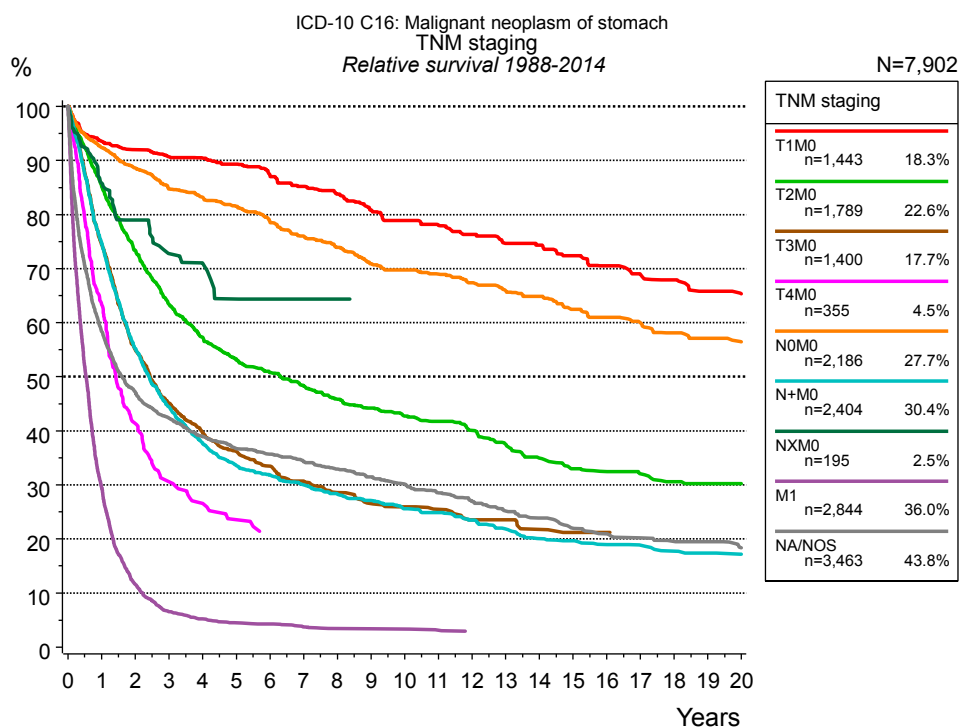

Figure 4e. Relative survival of patients with stomach cancer by TNM staging. For 9,177 of 11,365 cases diagnosed between 1988 and 2014 valid data could be obtained for this item. For a total of 7,902 cases an evaluable classification was established. The accumulated percentage exceeds the 100% value because patients are potentially considered in more than one subgroup. The grey line represents the subgroup of 3,463 patients with missing values regarding TNM staging (30.5 % of 11,365 patients, the percent values of all other categories are related to n=7,902).

Table 4f. Observed (obs.) and relative (rel.) survival of patients with stomach cancer by TNM staging for period 1988-2014 (N=7,902).

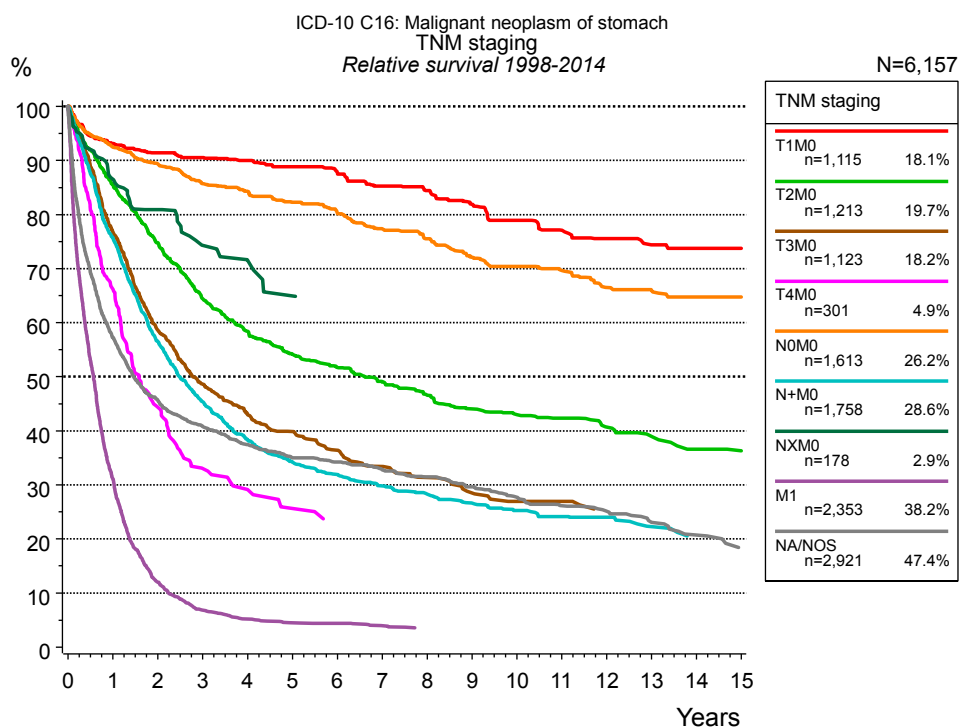

Figure 4g. Relative survival of patients with stomach cancer by TNM staging. For 7,162 of 9,078 cases diagnosed between 1998 and 2014 valid data could be obtained for this item. For a total of 6,157 cases an evaluable classification was established. The accumulated percentage exceeds the 100% value because patients are potentially considered in more than one subgroup. The grey line represents the subgroup of 2,921 patients with missing values regarding TNM staging (32.2 % of 9,078 patients, the percent values of all other categories are related to n=6,157).

Table 4h. Observed (obs.) and relative (rel.) survival of patients with stomach cancer by TNM staging for period 1998-2014 (N=6,157).

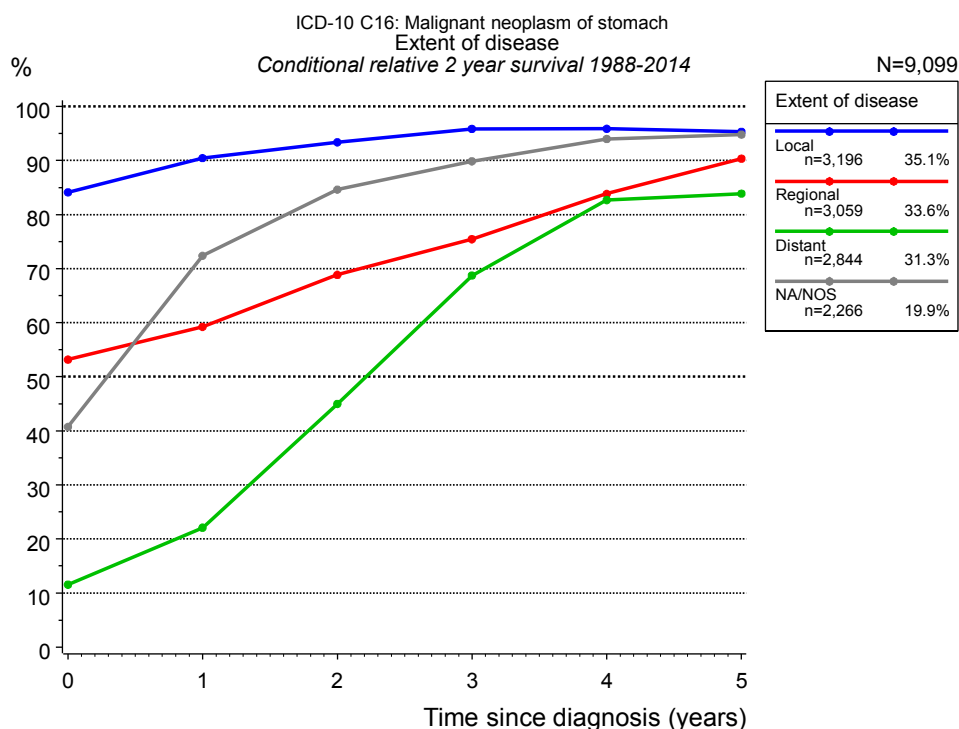

Figure 4i. Conditional relative 2-year survival of patients with stomach cancer by extent of disease. For 9,177 of 11,365 cases diagnosed between 1988 and 2014 valid data could be obtained for this item. For a total of 9,099 cases an evaluable classification was established. The grey line represents the subgroup of 2,266 patients with missing values regarding extent of disease (19.9% of 11,365 patients, the percent values of all other categories are related to n=9,099).

Years	Extent of disease							
	Local		Regional		Distant		NA/NOS	
	n	Cond. surv. % 2 yrs	n	Cond. surv. % 2 yrs	n	Cond. surv. % 2 yrs	n	Cond. surv. % 2 yrs
0	3,196	84.1	3,059	53.2	2,844	11.6	2,266	40.7
1	2,579	90.5	2,061	59.2	768	22.1	1,033	72.4
2	2,212	93.4	1,394	68.9	273	45.0	746	84.6
3	1,905	95.9	1,027	75.5	134	68.7	618	89.9
4	1,644	95.9	791	83.8	97	82.7	500	94.0
5	1,430	95.3	633	90.3	75	83.9	428	94.8

Table 4j. Conditional relative 2-year survival of patients with stomach cancer by extent of disease for period 1988-2014 (N=9,099).

Conditional relative survival rates refer to the relative survival probability, in this case for 2 years after cancer diagnosis, compared to the age- and sex-matched population (=100%) under the condition of being alive for a certain time period (x-axis in Figure 4g). The results illustrate to what extent the cancer induced mortality of particular subgroups declines in the subsequent years after detection of the malignancy. For instance, according to the presented survival statistics, patients in the subgroup extent of disease="Local", who are alive at least 3 years after cancer diagnosis, the conditional relative 2-year survival rate is 95.9% (n=1,905).

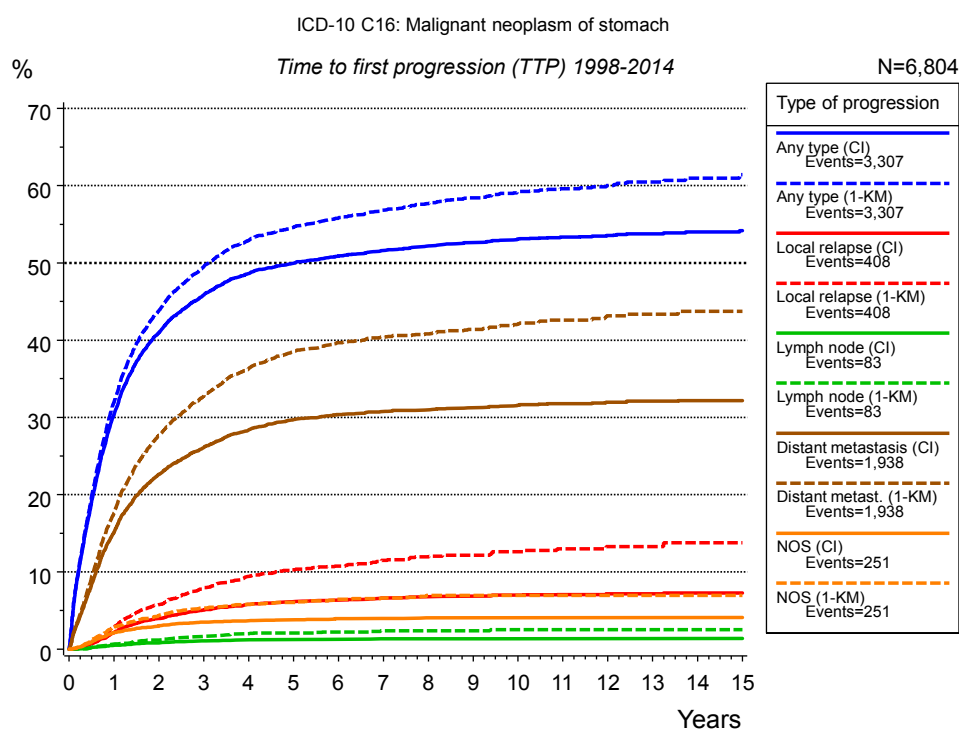

Figure 5a. Time to first progression of 6,804 patients with stomach cancer diagnosed between 1998 and 2014 (M0 only in solid cancers) estimated by cumulative incidence function (CI, solid line) accounting for death as competing risk and by inverse Kaplan-Meier estimate (1-KM, dashed line). The frequency of events may be underestimated due to underreporting.

Years	Type of progression						
	Any type (CI)	Any type (1-KM)	Local relapse (CI)	Local relapse (1-KM)	Lymph node (CI)	Lymph node (1-KM)	Distant metastasis (CI)

Table 5b. Time to first progression of patients with stomach cancer for period 1998-2014 (N=6,804).

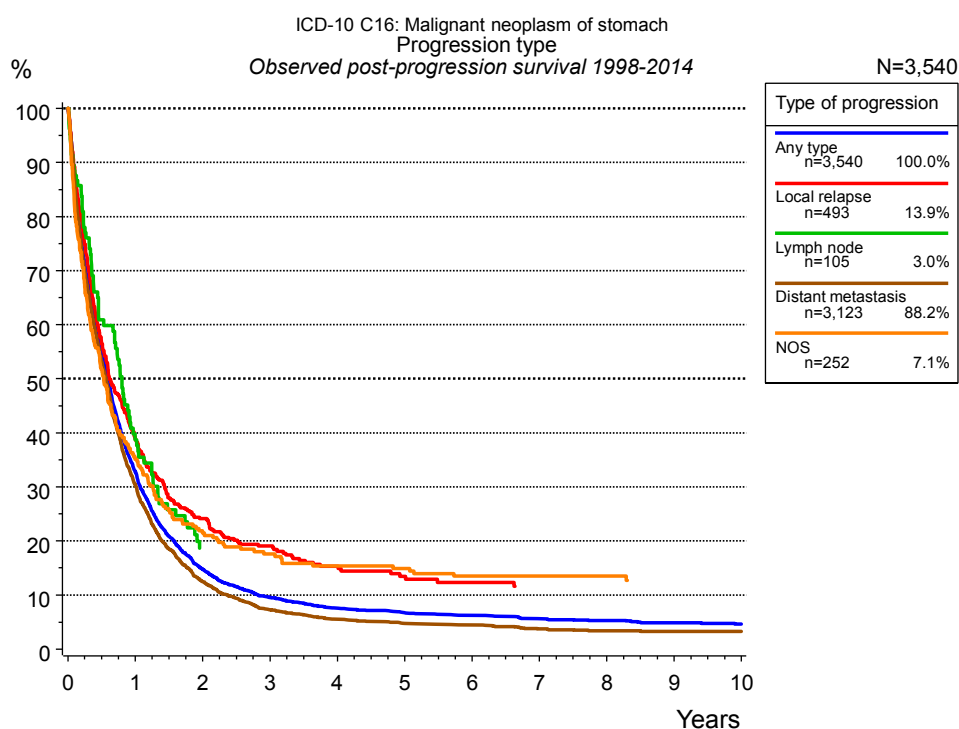

Figure 5c. Observed post-progression survival of 3,540 patients with stomach cancer diagnosed between 1998 and 2014. These 3,540 patients with documented progression events during their course of disease represent 39.2% of the totally 9,035 evaluated cases (incl. M1, n=2,231, 24.7%). Patients with cancer relapse documented via death certificates only were excluded (n=1,998, 22.1%). Multiple progression types on different sites are included in the evaluation even when not occurring synchronously. The NOS (not otherwise specified) class is included under the condition, that it is the one and only progression type during the course of disease.

Medical record documentation often lacks the linguistic severity to distinguish between local relapse, regional lymph node metastasis and distant spread in solid cancers. Frequently, the statement “not specified” is the only information in registries regarding relapse of the disease. The category “Any type” denotes all cases who suffered from at least one relapse during the course of disease (incl. primary M1-status). Although, the real number of relapsed patients is likely to be much higher. The accumulated percentage of patients with local relapse or distant metastasis exceeds the 100% value because patients are potentially considered in more than one subgroup.

Years	Type of progression				
	Any type n=3,540 %	Local relapse n=493 %	Lymph node n=105 %	Distant metastasis n=3,123 %	NOS n=252 %
