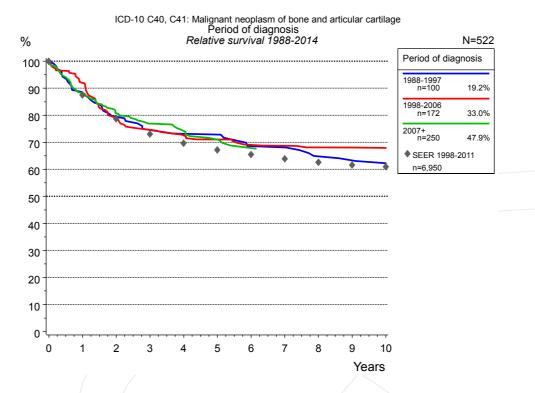

Figure 1a. Relative survival of patients with bone cancer by period of diagnosis. Included in the evaluation are 522 cases diagnosed between 1988 and 2014.

The survival results of the SEER program (Surveillance, Epidemiology, and End Results) of the American National Cancer Institute (NCI) are summarized as the period of diagnosis from 1998 to 2011, and are represented by gray diamonds in order to facilitate comparisons between MCR and SEER.

The presented survival curves are derived from clinical records with valid follow-up informations, which means that death certificate cases (DCO) cases are omitted from the analysis. With this one restriction, the MCR has provided population-based statistics since 1998, collecting data on all cancer cases in the region of southern Bavaria. Historical data of previous time periods can be heavily selected, therefore, univariate survival comparisons of the presented time periods must be carefully considered. Nonetheless, all calculable survival curves are depicted to facilitate the comparison of long time follow-up analyses of relative survival between particular cancers.

| Period of diagnosis | | | | | | |

Table 3b. Observed (obs.) and relative (rel.) survival of patients with bone cancer by age category for period 1988-2014 (N=522).

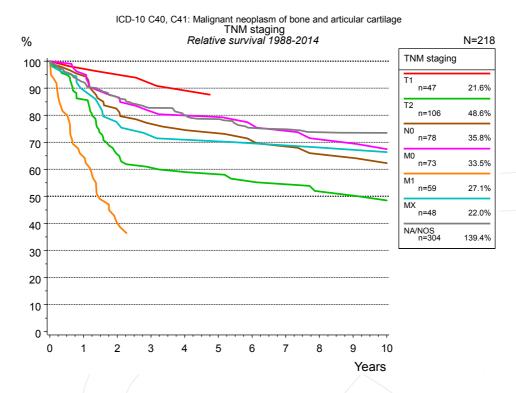

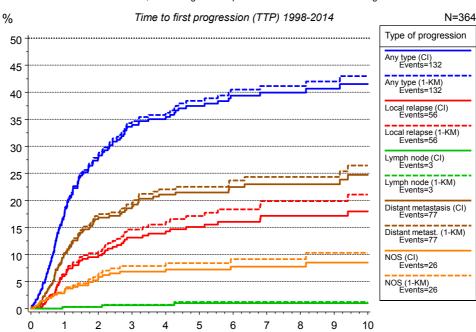

Figure 4a. Relative survival of patients with bone cancer by TNM staging. For 219 of 522 cases diagnosed between 1988 and 2014 valid data could be obtained for this item. For a total of 218 cases an evaluable classification was established. The accumulated percentage exceeds the 100% value because patients are potientially considered in more than one subgroup. The grey line represents the subgroup of 304 patients with missing values regarding TNM staging (58.2% of 522 patients, the percent values of all other categories are related to n=218).

| | TNM staging | | | | | | | | | | | | | |

| | | | | | | | | | | |

Table 5b. Time to first progression of patients with bone cancer for period 1998-2014 (N=364).

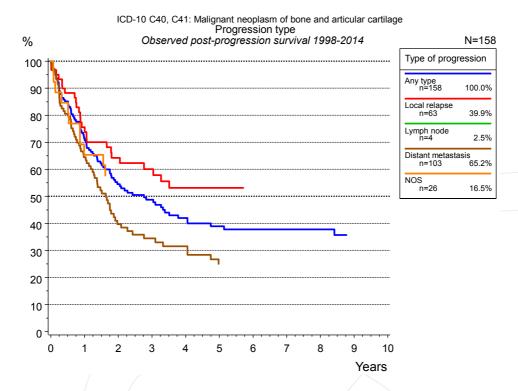

Figure 5c. Observed post-progression survival of 158 patients with bone cancer diagnosed between 1998 and 2014. These 158 patients with documented progression events during their course of disease represent 38.0 % of the totally 416 evaluated cases (incl. M1, n=52, 12.5 %). Patients with cancer relapse documented via death certificates only were excluded (n=26, 6.3 %). Multiple progression types on different sites are included in the evaluation even when not occuring synchronously. The NOS (not otherwise specified) class is included under the condition, that it is the one and only progression type during the course of disease. Subgroups with sample size <15 are dropped from the chart.

Medical record documentation often lacks the linguistic severity to distinguish between local relapse, regional lymph node metastasis and distant spread in solid cancers. Frequently, the statement "not specified" is the only information in registries regarding relapse of the disease. The category "Any type" denotes all cases who suffered from at least one relapse during the course of disease (incl. primary M1-status). Although, the real number of relapsed patients is likely to be much higher. The accumulated percentage of patients with local relapse or distant metastasis exceeds the 100% value because patients are potientially considered in more than one subgroup.

| Type of progression | | | | | | | | | | |
