ICD-10 C62: Malignant neoplasm of testis
Period of diagnosis
*Relative survival 1988-2014*

N=3,958

Figure 1a. Relative survival of patients with testicular cancer by period of diagnosis. Included in the evaluation are 3,958 cases diagnosed between 1988 and 2014.

The survival results of the SEER program (Surveillance, Epidemiology, and End Results) of the American National Cancer Institute (NCI) are summarized as the period of diagnosis from 1998 to 2011, and are represented by gray diamonds in order to facilitate comparisons between MCR and SEER.

The presented survival curves are derived from clinical records with valid follow-up informations, which means that death certificate cases (DCO) cases are omitted from the analysis. With this one restriction, the MCR has provided population-based statistics since 1998, collecting data on all cancer cases in the region of southern Bavaria. Historical data of previous time periods can be heavily selected, therefore, univariate survival comparisons of the presented time periods must be carefully considered. Nonetheless, all calculable survival curves are depicted to facilitate the comparison of long time follow-up analyses of relative survival between particular cancers.

ICD-10 C62: Malignant neoplasm of testis
NM staging
Relative survival 1988-2014

Figure 4a. Relative survival of patients with testicular cancer by NM staging. For 3,833 of 3,958 cases diagnosed between 1988 and 2014 valid data could be obtained for this item. For a total of 3,832 cases an evaluable classification was established. The grey line represents the subgroup of 126 patients with missing values regarding NM staging (3.2% of 3,958 patients, the percent values of all other categories are related to n=3,832).

ICD-10 C62: Malignant neoplasm of testis
Extent of disease
*Conditional relative 5 year survival 1988-2014*

Figure 4e. Conditional relative 5-year survival of patients with testicular cancer by extent of disease. For 3,833 of 3,958 cases diagnosed between 1988 and 2014 valid data could be obtained for this item. For a total of 3,829 cases an evaluable classification was established. The grey line represents the subgroup of 129 patients with missing values regarding extent of disease (3.3% of 3,958 patients, the percent values of all other categories are related to n=3,829).

	Extent of disease							
	Local		Regional		Distant		NA/NOS	
		Cond. surv. %		Cond. surv. %		Cond. surv. %		Cond. surv. %
Years	n	5 yrs	n	5 yrs	n	5 yrs	n	5 yrs
0	3,022	99.2	482	96.8	325	82.9	129	89.5
1	2,756	99.6	450	97.1	275	92.5	110	96.3
2	2,542	99.4	419	98.2	242	96.5	103	98.7
3	2,332	99.6	394	98.7	223	98.3	95	101.2
4	2,137	99.9	379	98.9	207	98.1	88	100.5
5	1,951	99.9	339	99.7	191	97.2	83	100.0

Table 4f. Conditional relative 5-year survival of patients with testicular cancer by extent of disease for period 1988-2014 (N=3,829).

Conditional relative survival rates refer to the relative survival probability, in this case for 5 years after cancer diagnosis, compared to the age- and sex-matched population (=100%) under the condition of being alive for a certain time period (x-axis in Figure 4c). The results illustrate to what extent the cancer induced mortality of particular subgroups declines in the subsequent years after detection of the malignancy. For instance, according to the presented survival statistics, patients in the subgroup extent of disease="Local", who are alive at least 3 years after cancer diagnosis, the conditional relative 5-year survival rate is 99.6% (n=2,332).
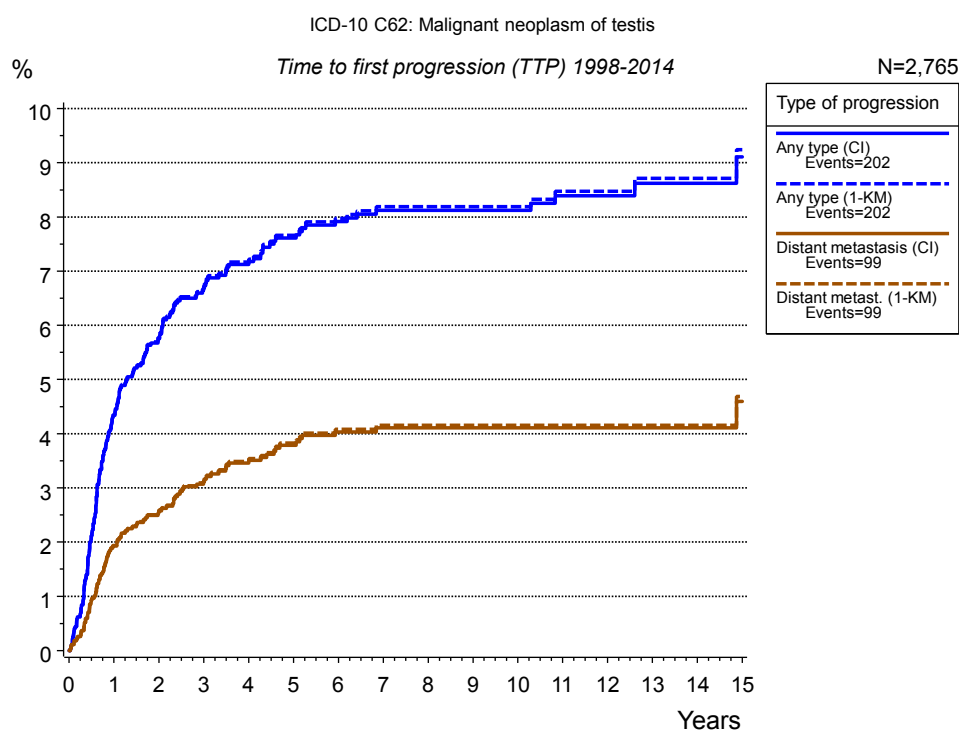

ICD-10 C62: Malignant neoplasm of testis

Figure 5a. Time to first progression of 2,765 patients with testicular cancer diagnosed between 1998 and 2014 (M0 only in solid cancers) estimated by cumulative incidence function (CI, solid line) accounting for death as competing risk and by inverse Kaplan-Meier estimate (1-KM, dashed line). The frequency of events may be underestimated due to underreporting.

	Type of progression			
	Any type (CI)	Any type (1-KM)	Distant metastasis (CI)	Distant metast. (1-KM)
	n=2,765	n=2,765	n=2,765	n=2,765
Years	%	%	%	%
0	0.0	0.0	0.0	0.0
1	4.3	4.4	1.9	1.9
2	5.8	5.8	2.5	2.5

11	8.4	8.5	4.1	4.2
12	8.4	8.5	4.1	4.2
13	8.6	8.7	4.1	4.2
14	8.6	8.7	4.1	4.2
15	9.1	9.2	4.6	4.7

Table 5b. Time to first progression of patients with testicular cancer for period 1998-2014 (N=2,765).

ICD-10 C62: Malignant neoplasm of testis
Progression type
*Observed post-progression survival 1998-2014*

Figure 5c. Observed post-progression survival of 431 patients with testicular cancer diagnosed between 1998 and 2014. These 431 patients with documented progression events during their course of disease represent 14.3 % of the totally 3,007 evaluated cases (incl. M1, n=242, 8.0 %). Patients with cancer relapse documented via death certificates only were excluded (n=13, 0.4 %). Multiple progression types on different sites are included in the evaluation even when not occuring synchronously.

Medical record documentation often lacks the linguistic severity to distinguish between local relapse, regional lymph node metastasis and distant spread in solid cancers. Frequently, the statement "not specified" is the only information in registries regarding relapse of the disease. The category "Any type" denotes all cases who suffered from at least one relapse during the course of disease (incl. primary M1-status). Although, the real number of relapsed patients is likely to be much higher. The accumulated percentage of patients with local relapse or distant metastasis exceeds the 100% value because patients are potientially considered in more than one subgroup.

| | Type of progression | |
| | Any type n=431 | Distant metastasis n=330 |
Years	%	%
0	100.0	100.0
1	90.3	88.4
2	87.2	84.1
